15 "	8½ inch "	"	51 "	22 00

Warranted to work as represented when properly managed.

When ordering machines mention width of cut and style.

GRAHAM, EMLÉN & PASSMORE,

No. 631 Market Street,

PHILADELPHIA, PA.

1879.

The Philadelphia Lawn Mower

WAS AWARDED THE

FIRST PRIZE AT PARIS LAST YEAR.

We did not intend to exhibit at Paris, but our European Agent finding all other American Lawn Mowers there, entered for competition a PHILADELPHIA, taken out of the stock sent him for regular sales, and won a complete victory in the very exhaustive field trial, over all competitors, which was attested by granting him the

FIRST PRIZE MEDAL.

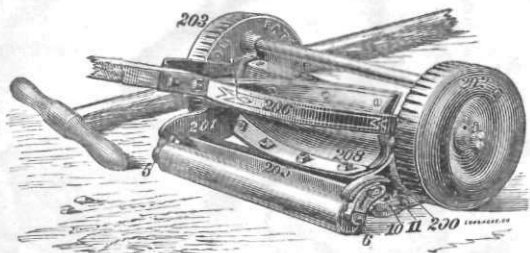

This, together with the victory at Cologne, Germany, in 1875, at Philadelphia in 1876, and at the various State and County Fairs since then, show that the well-earned reputation of the Philadelphia Lawn Mower being **THE BEST**, is fully maintained. This uniformity of excellence is what increased our sales last year over 3000 machines. Ask those using The Philadelphia, which is the best.

We have remodeled all our patterns, and are now building for 1879 stock, what we believe to be the best Lawn Mower ever produced. We repeat what we said last year, "we never stop in our effort to better them."

The Philadelphia Lawn Mowers have attained such a world wide reputation, that several imitations have been placed on the market, which, while lacking many of the qualities of good Lawn Mowers, so much resemble the PHILADELPHIA as to require care on the part of purchasers to avoid being deceived. Be sure to get the genuine PHILADELPHIA.

GRAHAM, EMLÉN & PASSMORE,

Patentees and Manufacturers.

This cut represents our new 15 inch Mower, with $8\frac{1}{2}$ inch driving wheels, and $9\frac{1}{2}$ inch wiper or revolving knife-cylinder. It weighs 51 lbs., runs light for one man, and does perfect work. On large open lawns it is a very desirable size.

We especially recommend our $6\frac{1}{2}$ inch driving wheel machines, cuts of which we print on the outside pages.

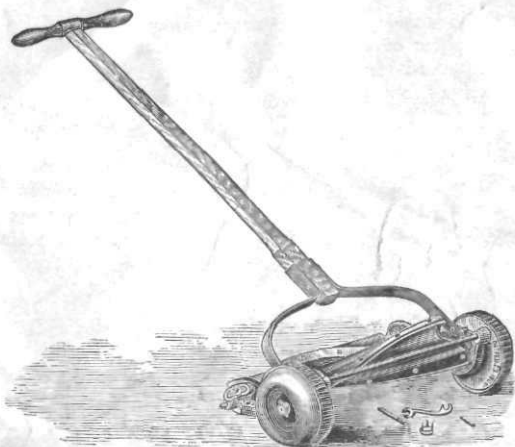

We make five sizes of this style, which may be chosen according to the size of the lawn: for small lawns or city grass plots, the 10 inch, 12 inch and 14 inch are sufficient, but for general purposes, and where the lawn covers one-eighth of an acre and over, the 16 inch is the best size. Where the ground is smooth and the grass is cut every week, the 18 inch and 20 inch are used to advantage.

As these machines may be seen in operation in nearly every town and village throughout the United States and Canada, any lengthy description of them is deemed unnecessary. They are by far the lightest running and easiest handled machines made, and are warranted to do as good work as any lawn mower in the market.

We ask the special attention of those using the Philadelphia Lawn Mowers to the PRINTED DIRECTIONS sent with each machine, and to the fact, that if kept properly adjusted they are **self-sharpening**, and are so simple and compact that it is almost impossible to get them out of order unless unreasonably abused.

Transferred from Acc 50

Philadelphia Lawn Mower, 14 inch cut.

Recollect that Philadelphia Lawn Mowers did work on the Centennial Grounds equal to ten years ordinary wear, without any loss of time for sharpening or repairs. CAUSE. — They are self-sharpening—and all wear of the wiper journals can be taken up by set screws.

*Remember that they have been awarded the **FIRST PRIZE** at all the World Fairs, and at nearly every Field Trial and Exhibition in which they have competed, and in private use they have fully established their reputation as*

THE BEST.
